OG Companion

Investor portfolio

Product validation, proposed users and commercial due diligence for a Windows desktop workbench.

Rob Johnston | Commercial evidence basis: 14 October 2026

Product and proposed users

User task

Translate a program idea into libraries, reference examples and an editable foundation without first knowing every package name.

Proposed audiences

Independent learners, teaching groups and developers exploring another language. These audiences are hypotheses for pilot validation.

Current product basis

The rebuilt Windows application combines code building and guidance with library browsing. A separate model tab provides explicit connection.

Evidence to collect

Observe successful task completion, retained edits, code comprehension and support needs. Demand and willingness to pay have not been established.

Commercial validation route

Initial pilot

A proposed supervised Windows pilot would use defined learning tasks, attributed examples and clear expectations about AI drafts.

Commercial options

Education deployment, support and a maintained example catalogue are options to test. They are not approved products or established revenue streams.

Decision evidence

Separate classroom usability, model quality and library-source coverage. A successful code extraction is not proof that a learner can run it.

Financial basis

Pricing, paid users, revenue, operating budget and funding requirements are not verified. A financial forecast requires owner inputs and pilot evidence.

Infrastructure and cost drivers

Desktop application

The portable Windows package includes Python and Qt. Its executable passes the installation check. A clean recipient computer still needs validation.

Optional local AI

Each user supplies a running model service and sufficient local hardware. Reference libraries work independently. Quality and processing time vary by model.

Public data dependencies

Live searches and uncached documentation need internet access. Provider availability and rate limits affect the user experience.

Budget inputs

Allow for release testing, support, licence review, catalogue maintenance and any chosen model distribution. No supplier quotation or scale-up budget is claimed.

Ownership and content diligence

Application and branding

OG Companion source and the supplied logo/icon are the product assets. Ownership records and any commercial terms need formal confirmation.

Third-party examples

14 bundled collections include their source-licence files. Loaded examples preserve source and attribution; permitted reuse still depends on the source terms.

Information handling

Search terms go to public providers. Custom prompts and code go to the selected localhost service. Service configuration determines inference location.

Commercial review

Brand clearance, distribution licences, support terms and any IP protection require appropriate review. No valuation or granted-rights claim is made.

Release and investment readiness

Verified now

The rebuilt executable, 106 checks and controlled foundations provide operating evidence. A larger local model produced one tested reusable module.

Current constraint

A small model ignored an explicit module requirement and the app rejected it. Wider model quality, recipient acceptance and commercial demand need validation.

Next product evidence

The next pilot should measure realistic task completion and code comprehension on recipient computers, alongside local-model setup and support needs.

Investment basis

A funding proposal should follow confirmed ownership, pilot demand, delivery costs and support assumptions. Those inputs are not yet established.
