OG WEB.SITE

OG Companion

Product and technical portfolio

A desktop workbench for library discovery, public code examples and editable program foundations.

Rob Johnston | Source evidence: 14 October 2026

The coding workbench

Build code accepts a program idea and returns editable source with guidance.

Browse libraries and Local models have their own tabs. Connect a model explicitly, or use supplied and retrieved examples without AI.

Application architecture

Desktop interface

og_companion.py coordinates three Qt tabs, background workers and the editable source. Startup fits the display work area and remembers the chosen monitor.

Discovery and generation

og_companion_search.py handles task matching and registries. It discovers recipient model services and validates Python responses before display.

Documentation and source retrieval

og_companion_sources.py retrieves public HTTPS text, extracts code blocks and supports full collections with per-collection deduplication.

Local resources

The catalogue and supplied assets sit beside the executable. Caches and service URLs belong to each user. Model weights remain separate.

Content scope

Discovery

22 language/tool choices, including CMake. Seven registry adapters directly cover 11 choices; other routes use documentation and public source discovery.

Documentation catalogue

244 collection titles across 837 published editions. These are versions and documentation sets, rather than 837 unique libraries.

Included material

31 teaching snippets across 14 languages, two Python foundations and 14 licensed example collections.

Measured source blocks

The 14 supplied collections contain 84,512 summed blocks. The sum is per collection, includes configuration/transcripts and is not a count of runnable programs.

Operating evidence and limits

Current source

106 automated checks passed on 14/10/2026. The packaged executable loads both foundations, three tabs, clearing and undo.

Branding

The original PNG and ICO remain intact. A smoothly scaled circle forms the background, with softer contrast and readable code colours.

Current release

The Windows 2.2 executable runs from the canonical application folder. Its native visible frame fits screen 3, including the title bar.

Outstanding verification

The interface was inspected at 1280 x 720 and 960 x 700 logical sizes. A clean second computer and live LM Studio installation remain separate checks.

Development and use boundaries

Custom program drafts

Custom drafts use a connected Ollama, LM Studio or compatible local service. One qwen2.5:3b module passed controlled file-count and missing-folder tests.

Public reference content

Sources retain URLs and attribution. The app fetches public HTTPS text and rejects local/private source destinations; it does not run retrieved code.

Code ownership

The OG application and brand are distinct from third-party reference examples. Their supplied source-licence files remain with the collections.

Distribution

The Windows ZIP includes its runtime, assets and examples. Recipient acceptance and broader provider checks remain distinct from local build evidence.
